ENSFromWei

Project name

What category does your project belong to? *

Infrastructure

What emoji best represents your project? *

If you have a demonstration, link to it here! *

<https://etherscan.io/address/martindengler.fromwei.eth>

Short description *

A max 100-character or less description of your project (it should fit in a tweet!)

Adds an ENSIP-10-compatible fallback resolver to resolve .wei names (see description) using ENS

Description *

Go in as much detail as you can about what this project is. Please be as clear as possible! (min 280 characters)

This project is a solidity contract that performs ENSIP-10-compliant resolution to resolve *.fromwei.eth` as a .wei name[^1].

We implement `resolve(..)` and call the Wei Name Service contract to resolve the name, then return that.

How it's made *

Tell us about how you built this project; the nitty-gritty details. What technologies did you use? How are they pieced together? If you used any partner technologies, how did it benefit your project? Did you do anything particularly hacky that's notable and worth mentioning? (min 280 characters)

This project uses ideas from <https://github.com/z0r0z/zolidity> and <https://github.com/z0r0z/wei-names> , as well, of course, as ENSIP-10 (<https://docs.ens.domains/ensip/10>).

I am a beginning solidity developer coming from TradFi with a CS degree and 25+ years of python/java/etc experience (<https://linkedin.com/in/mdengler>) so getting used to the EVM

GitHub Repositories *

Add any repositories that contain code for your project. Please make sure the repositories are public.

Project rules

Project should start from scratch

You may not add features to existing work but can use boilerplate code.

Project should use version control

You must commit frequently and not have small commits with large changes on github.

Project should be open source

You repo must remain public for anyone to verify your work.

Project video should not exceed 4 minutes

Attempts to speed-up video will disqualify your submission. This will be verified manually.
